For a Java project I am working on there is a function that calls a set of several static utility methods. In these functions there is a lot of floating point arithmetic. Now,

---

whenever I execute the program there are moments when this function takes a very long time. I want to figure out if the problem is in my own code or in the library I am using (if it's in the latter then I want to fix it - I prefer to be told if the issue is the library). In our project we use Eclipse and we have various breakpoints, so I can step through the function's code. I also have logs, so I can look at them (and I added timestamps). However, sometimes I don't know whether to stop at a breakpoint or not, or to look at the logs. Does anyone

---

have a tip how to figure out which part in  
the code takes a long time? 09e8f5149f

- Provides a clear view of the root system and allows the measurement of traits for each root.
- 3D models of the root system and root traits measurements are made possible.
- RootTrak Reads  $\mu$ CT scans in.nii format or MAT files in.mat format.
- RootTrak Features:
  - Reads.mat files generated by Xradia RAVE or e.g. STLabeler.
  - Reads.nii files generated by e.g. Avizo or RAMI from a local folder.
  - Visualizes and measures the root system.

---

Reads locally embedded  $\mu$ CT scans and 3D models. - Assigns a number to each root, as well as the root total volume and traits measurements. - Prints root number, total root volume, root diameter, root length, root total surface, root traits (e.g. root surface, root volume, specific root length) or root traits (e.g. root surface, root volume, specific root length). -

RooTrak Statistics: - Reports root mean surface, root total surface and root traits - Prints in tables the following plant traits for each root: root diameter, total length,
